Project: Service booking e-commerce platform

Deliverable: Responsive front-end prototype and finalized visual design system

Date: 10 September 2026

1. Project overview

Bookly is a service-commerce marketplace that helps customers discover, compare, and book trusted local professionals. The initial prototype has been translated into a standards-based implementation using HTML5, CSS3, JavaScript, Bootstrap 5, and browser localStorage.

Implemented experience

Home	Header, navigation, hero, trust indicators, categories, social proof, promotional CTA, and footer.
Service listing	Search, category filtering, transparent rates, provider ratings, and responsive product cards.
Provider details	Service configuration, date and duration selection, detailed inclusions, review, and add-to-cart action.
Cart and checkout	Persistent local cart, calculated totals, customer details, payment mockup, and confirmation state.
Customer account	Upcoming and past bookings, saved providers, and editable profile settings.
Design system	A browser-based reference for brand, colour, typography, controls, cards, icons, and photography.

Responsive behavior

The layout uses mobile-first breakpoints. Navigation collapses to a menu, card grids stack naturally, hero imagery is simplified on small screens, and sticky checkout panels become standard flow content. Touch targets, form contrast, and meaningful alt text are included.

2. Updated visual design system

Official identity

Store name: Bookly

Logo: A rounded ocean-and-teal tile containing a white “B”, paired with a Fraunces Semibold wordmark. The compact mark remains legible in mobile navigation and browser icons.

Colour palette

Name	Hex	Use
Ocean	#123B4A	Primary brand, navigation, main actions
Teal	#207F73	Trust signals, prices, active controls
Coral	#F26B4F	Highlights and conversion actions
Mist	#F7F8F6	Page background
Ink	#132B30	Primary text
Border	#DCE5E2	Dividers and card outlines

Typography

Headings and subheadings: Fraunces, 500-700 weights. Expressive, editorial, and confident. **Body and interface:** DM Sans, 400-700 weights. Clean and readable for filters, forms, and transactional content. **Fallbacks:** Georgia for display; system-ui and sans-serif for body.

UI components

Buttons: 12px corner radius, semibold DM Sans, ocean for primary actions, coral for conversion actions, and white for secondary actions.

Inputs: 1.5px cool-gray border, 12px radius, generous vertical padding, teal focus ring.

Cards: White surface, 16px radius, subtle border, and controlled lift on hover.

Icons: Familiar symbols inside compact teal-tinted tiles.

Photography: Natural light, genuine working environments, warm neutral grading, and capable professionals.

3. Information architecture

Home	Service listing	Provider details	Cart	Checkout	Confirmation
Discovery	Comparison	Decision	Review	Transaction	Account

Navigation model

The global header keeps Home, Services, How it works, For providers, the design-system reference, Cart, and Account visible on desktop. On mobile, content links collapse while Cart remains immediately accessible. The footer repeats key paths and adds a newsletter pattern.

Unique feature: service-commerce booking cart

Unlike a conventional product cart, a Bookly line item stores a provider, selected service, preferred date, duration, and calculated service price. localStorage preserves the booking during navigation, and the checkout page turns the selection into a clear appointment summary.

Content principles

Headlines are concise and human. Pricing is visible before commitment. Risk-reduction messages appear beside conversion actions. Calls to action use specific verbs: Find, View and book, Add booking, Continue, and Confirm.

4. Technical implementation

HTML5	Semantic main, section, article, nav, aside, form, header, and footer structures.
CSS3	Custom properties, responsive grid refinements, focus states, hover motion, sticky summaries, and design tokens.
JavaScript	Shared header/footer, provider rendering and filtering, localStorage cart, calculated totals, account tabs, and confirmation state.
Bootstrap 5	Responsive containers, columns, spacing utilities, and predictable baseline layout.
Assets	Google Fonts and curated Unsplash photography loaded through CDN URLs.

README.txt

Prototype limitations

This is a front-end demonstration. Payment fields do not transmit data, account content is sample data, and no production authentication or provider API is connected. The external font, framework, and photography assets require an internet connection.

5. Completion checklist

- Official store name and logo
- Hex-coded colour system
- Heading, subheading, and body fonts
- Button and input-field styles
- Product/provider card and icon styles
- Photography direction
- Header and responsive navigation
- Hero section and service categories
- Featured/recommended providers
- Promotional provider section
- Calls to action and footer
- Product/service listing
- Provider detail page
- Shopping cart

- Checkout flow
- Customer account
- Mobile and desktop mockup folders
- README and implementation notes

Status

The requested initial implementation and finalized visual system are complete and consistently applied across the supplied mockups and website pages.
